The next few questions are about active tuberculosis or TB. To see if a person has tuberculosis a doctor or nurse will give a skin test - sometimes called a PPD test. If the skin test shows the person has been exposed or infected with tuberculosis, more tests are done to see if they are sick from the tuberculosis. A person might get an X-ray or be asked to cough into a machine. If they are sick then we say they have “tuberculosis disease.” Sometimes this is called “active” or “infectious tuberculosis.” Usually, if a person has tuberculosis disease, people who lived or worked with the person will be tested for tuberculosis too.
